CATEGORIES OF PUBLICATION

ORD Reports are the most authoritative and most carefully considered publications of the DGOR scientific community. They normally embody the results of major research activities or are significant works of lasting value or provide a comprehensive view on major defence research initiatives. ORD Reports are approved personally by DGOR, and are subject to peer review.

ORD Project Reports record the analysis and results of studies conducted for specific sponsors. This Category is the main vehicle to report completed research to the sponsors and may also describe a significant milestone in ongoing work. They are approved by DGOR and are subject to peer review. They are released initially to sponsors and may, with sponsor approval, be released to other agencies having an interest in the material.

Directorate Research Notes are issued by directorates. They are intended to outline, develop or document proposals, ideas, analysis or models which do not warrant more formal publication. They may record development work done in support of sponsored projects which could be applied elsewhere in the future. As such they help serve as the corporate scientific memory of the directorates.

ORD Journal Reprints provide readily available copies of articles published with DGOR approval, by OR researchers in learned journals, open technical publications, proceedings, etc.

ORD Contractor Reports document research done under contract of DGOR agencies by industrial concerns, universities, consultants, other government departments or agencies, etc. The scientific content is the responsibility of the originator but has been reviewed by the scientific authority for the contract and approved for release by DGOR.

Directorate Research Notes are written to document material which does not warrant or require more formal publication. The contents do not necessarily reflect the view of ORD or the Canadian Department of National Defence..

OTTAWA, ONTARIO

MARCH 1998

ABSTRACT

The problem of scaling general stores for deployed Canadian Contingents was investigated. Weaknesses in the current system were identified. A baseline general stores scale was created based upon consumption data from the deployment to Former Yugoslavia. A prototype software application for review and customisation of the baseline scale was developed. An improved scaling process was proposed which shortens the scaling process and enables general stores to be sustained in theatre more easily. Recommendations for future work in this field were provided.

A HEURISTIC APPROACH TO GENERAL STORES SCALING FOR DEPLOYED OPERATIONS

I. INTRODUCTION

1. The Canadian Forces (CF), has a long history of deploying troops domestically and internationally. Each deployment is unique. The size, composition, and role of the forces employed on a mission are determined by the situation which requires intervention. Additionally, each mission differs due to the climatic and operational conditions that are present. For example, the deployment of forces to battle the Manitoba flood of 1997 varied greatly from the deployment of forces to Former Yugoslavia (FY). The Manitoba deployment was a domestic response to a natural disaster. There was no threat of hostilities but massive numbers of troops were required for a relatively short but intense period. The tasks to be performed were flood related and the climatic conditions were very familiar to our forces. In contrast, the deployment of forces to FY was part of an international peace initiative where there was a serious threat of hostilities. The tasks to be performed concerned peace keeping. The climatic conditions were different than what we encounter in Canada. The operational tempo has varied greatly during the term of the deployment. Fewer troops were deployed to FY than to Manitoba. This example illustrates the point that no two deployments are alike.

2. In order for missions to be successful they must be well planned and well supported. Since most deployments are unique, standard plans and support mechanisms must be adapted to suit the peculiarities of each operation. Many deployments are responses to unforecasted events; therefore, they often take place on short notice. This requirement to develop unique operational and support plans for each deployment combined with the short planning period creates many difficulties for deployed contingents.

3. One aspect of support planning that is critical during deployment planning is material scaling. A J4 Log study of material and financial accountability during deployed operations identified material scaling as a significant weakness in DND support capabilities. It established a goal to enhance our ability to scale for deployed operations on short notice [1]. The required scaling capability was later divided into two parts: repair parts scaling and general stores scaling. J4 Log tasked the Logistics Operational Research Team (LOGORT) to determine a better general stores scaling method [2]. LOGORT was subsequently disbanded and the Joint Staff Operational Research Team (JSORT) assumed the project.

II. SCALING

4. According to Canadian (CA) military doctrine, units deploy with enough supplies to remain self-sufficient for a specified duration. In order to achieve the desired level of self-sufficiency, one must identify what material is required and acquire it before the contingent deploys. The identification and acquisition of material for deployed operations is referred to as scaling. Scaling is a two step process. Initially one must determine the composition and quantity of supplies that will establish the desired level of self-sufficiency. A listing of this material is often referred to as a scale. Secondly, one must acquire the material identified in the scale for the deploying contingent. This is referred to as scale implementation or assembly of stocks. Scale development is not a trivial task. It requires a high level of insight into the mission being prepared for. Only by knowing what will be consumed, can an appropriate scale be developed. This degree of insight seldom exists. Due to the unique nature of each deployment, the consumption of material varies from one deployment to the next. Therefore, each deployment requires a different scale of material. Scale implementation is usually a very labour intensive and time-consuming activity. There exists no process to allow the extraordinarily large number of items included in most scales to be acquired expeditiously.

5. Current scaling methods are extremely rudimentary and slow. "Experts" from the deploying unit create a list of materials they expect to require by considering all possible items. They determine how much of each material is required based upon their experience. This process is often exasperated by a lack of knowledge of the mission being undertaken and inadequate time to consider all factors that affect the scale. Consequently, current scales are often incomplete and inaccurate. After the scale is created, computer transactions for each item on the scale must be entered into the Canadian Forces Supply System (CFSS). This practice is slow and prone to error. As a result there is seldom enough time for the CFSS to respond to the demands for material which causes the material to arrive late. When material does arrive, it must be accounted for and prepared for shipment overseas. Due to all the delays in the scaling process, this important step is often rushed. This can result in material being unavailable for use upon arrival in theatre. All the weaknesses in the current scaling process combine to create inefficient, inaccurate, and poorly implemented material scales.

6. Supply inventories created by the scaling process vary from the actual requirements in several ways:

a. Items that should be stocked are overlooked resulting in material shortfalls,

b. Items are held in stock that are not required resulting in material surpluses/dormant stock, and

c. Items that are held in stock are held in the wrong quantity resulting in material deficiencies or surpluses.

The consequences of inadequate scaling are quite significant. There are direct and indirect costs of inadequate scaling which result in the unnecessary expenditure of public funds.

7. The direct costs of inadequate scaling are diverse. When a unit deploys with material holdings based upon an inaccurate or poorly implemented scale, the unit does not possess the material it needs. Material deficiencies result in requests for emergency replenishment. If the material is not readily available, emergency procurement must be initiated which often increases the cost of the material. Once the required material is available, it is sent by the fastest possible means to the unit. The cost of this method of replenishment often exceeds the value of the material being delivered. When an item is included in a scale in excessive quantities or when it is not required at all, the effects are no less significant. The excess material is shipped to the deployment area, stored in theatre during the deployment, and returned to Canada after the deployment or disposed of in-theatre. The shipping, warehousing, and disposal costs of unnecessary material are directly attributable to improper scaling. These activities increase the direct costs of deployments when these costs are avoidable.

8. There are also indirect costs due to poor scaling. The most important indirect cost is reduced operational effectiveness of the unit. If the unit does not have the material it needs to accomplish its mission, the operational effectiveness of the unit is decreased. The amount of impact a material deficiency has on a mission depends upon the importance of the deficient item. In all cases of material deficiencies, the unit experiences a delay in receiving material that could have been avoided had the initial scale been accurate. Improper scaling has indirect personnel costs associated with it. Material shortfalls result in excessive amounts of time being spent by the unit supply staff and national supply staff trying to resolve the deficiencies. When excess material is held by a deployed unit, the supply staff is required to receive, warehouse, account for, and re-deploy/dispose of this material. These efforts dealing with excess or deficient material reduce that amount of time available for the supply staff to perform their duties. As a

result, many of the tasks associated with material accountability are neglected. Improper scaling for deployments also has indirect material cost. Excess material on deployments means that the material is not available for use by other units in the CF. Additionally excess material held in theatre often deteriorates to the point that it is useless or it is lost resulting in wastage of the material. Therefore, the indirect costs of inadequate scaling are significant.

9. Due to the direct and indirect costs of poor material planning, scaling is an important part of deployment preparations. DNDs' policy of reducing unnecessary expenditures has gained importance in recent years. This has helped focus attention on the scaling process. Although accurate scaling is probably impossible due to the complexity of the task, improved scaling capabilities are achievable. A "smarter" scaling methodology will improve the scale quality by minimising material surpluses and deficiencies. An improved scaling process will reduce the time and effort requirements for scale creation and implementation tasks. All steps, which are taken to improve scaling for deployment planning, will reduce the direct and indirect costs of the deployments.

III. METHODOLOGY

10. The aim of this project was to enhance the general stores scaling capability for deploying contingents. In order to achieve this aim, a baseline scale of general stores was developed. This scale was developed based upon the historical material usage for a deployed contingent. A set of screening criteria was developed to reduce the scale to its most important elements. The baseline scale, which is discussed in section IV, can be used as a starting point for all future general stores activities. It can be used as a starting point for all future general stores scaling activities. The scale is discussed in section IV. Next a prototype tool was developed to help planners adapt the baseline scale to the unique characteristics of an operation. The tool was developed with close sponsor co-operation employing a rapid prototyping methodology. The scaling tool is discussed in section V. An improved scaling process was developed to reduce the time and effort required for general store scaling and replenishment planning. The process was developed during several brainstorming sessions with technical and subject matter experts. The improved process is discussed in section VI. Finally, recommendations regarding general stores scaling were developed. They are outlined in section VII.

IV. GENERAL STORES SCALE

11. Ideally, scales should reflect the expected usage of material. If one could identify all factors that influence material consumption and quantify the effect that they have on it, accurate consumption forecasting could be accomplished. This type of methodology is used for spare part scaling [3]. Unfortunately, in the case of general stores scaling, this is not possible or practical. Too many factors affect material consumption to adequately consider them all. Some factors do not affect consumption of general store consistently and many of these factors interact with each other in complex ways. In addition, many of the factors that affect consumption are not known until after the operation has commenced. Therefore, a less rigorous approach to the complex general stores scaling process was adopted.

12. One indicator of expected consumption is previous usage under similar circumstances. One can expect that material previously consumed will be consumed again under similar conditions. The advantage of employing prior usage information to forecast expected consumption is that the information is readily available. In the case of usage by a DND unit, CFSS computer records contain this information. This information, when properly treated, can be used to identify the consumption of material by specific contingents for specific periods.

13. CFSS transaction data is available from the CFSS Transaction History File (THF) application [1]. The THF provides raw transaction data concerning all supply activity in the CF. By identifying all supply accounts that were associated with the deployment under consideration, relevant transactions can be extracted for a specific period. With the assistance of D Sup, the appropriate transactions were identified for consumption calculations. Queries to the THF can combine all relevant customer demands on the CFSS with all supporting account issues to customer accounts. After a confirmation that all transactions represent unique supply events, consumption can be measured. The consumption calculation model is attached as Annex A.

14. After consultation with the sponsor, the CA contingent deployed to FY was selected as the activity to be studied for scale development purposes. The period selected for consideration was the calendar year 1996. This activity was selected for several reasons.

---

1 THF is a CD ROM based application that combines all CFSS computer transaction records in a database with tools to extract and manipulate the data. A new CD is released quarterly with the most recent computer transactions.

a. The activity was recent

b. The activity was of a significant scale (approximately 1000 persons),

c. The deployment lasted a significant period (four seasonal periods and two rotations), and

d. Good records existed for this operation.

The customer supply accounts of CF elements deployed in FY were identified, as was the supporting second line supply account. By combining the consumption of general stores by all CF customers in FY for the calendar year of 1996, the annual consumption of that contingent was identified.

15. The raw consumption data derived from CFSS transactions included approximately 9000 items with consumption records. In order to screen out inappropriate material from the scale the following steps were taken:

a. REMOVE "A" CLASS MATERIAL TRANSACTIONS. The CFSS has an accountability code system which identifies how material should be accounted for. "A" class materials are vehicles, weapon systems, or material requiring significant material control. This material is not considered consumable and is not held in general stores stocks during deployments. Therefore, all transactions regarding "A" class material were removed.

b. REMOVE "S" CLASS MATERIAL TRANSACTIONS. Material designated "S" class is accounted for by serial number. Currently the CFSS only employs this material accountability classification for weapons and major weapon components. This type of material is not consumable general stores. These transactions were removed from the consumption data.

c. REMOVE UNWANTED STOCK CLASS TRANSACTIONS. Items are categorised into different stock classes based upon their employment. For example, all items with a stock class 1305 belong to the group "Ammunition over 30 mm". Clearly, items that belong to this stock class should not be considered a consumable general store item. Many other

stock classes should not be considered either. For this reason, a list of eligible stock classes was used to reduce further the number of items considered. The list of stock classes that were included when selecting consumption data is attached at Annex B.

d. REMOVE ITEMS WITHOUT SIGNIFICANT CONSUMPTION. Many of the items which where suitable for inclusion in the scale according to the previously stated criteria did not have significant usage. There was not enough consumption to warrant consideration of the item in future scaling activities. An exclusion criterion was developed to screen out all material with less than nine units of usage in one year. The exclusion criterion was set at this level because it represented an average usage of .75 units per month. Units typically scale for a minimum of 30 days self-sufficiency. Expert advice confirmed that items with less than .75 units of usage in a month would justify exclusion from a 30-day scale.

16. After employing the screening criteria to the raw consumption data, the proposed scale was reduced to 1560 items. This scale is attached as Annex C. It contains general information about the items included in the scale, their annual usage, and their average monthly usage. Because the proposed scale was based upon the consumption of the 1000-person CA contingent in FY, it can be expected to reasonably forecast the consumption of future deployments with the same characteristics. With use and further review the scale can likely be further refined. As stated earlier this scale is not universally applicable for all future deployments.

V. GENERAL STORES SCALER

17. Since the scale listed at Annex C is not universally applicable to all deployments, it is not a solution to the scale development problems by itself. The scale is a good starting point for any general stores scaling activity but it would require considerable amendment to be valid for different deployments. That is not to say the scale has no value. It is much easier to amend a list of 1560 items than it is to generate a similar list from nothing. Once a planner understands the factors associated with a deployment which will make the general stores consumption different than what was experienced in FY during 1996, the baseline scale can be amended with some improvements in accuracy. Unfortunately even this process can be time consuming and labour intensive. Therefore it was determined that a prototype tool should be developed to assist planners who wish to review and amend the baseline scale for future deployments.

18. Experience has shown that the primary factor affecting general stores consumption is the size of the contingent. A 500-person contingent can be expected to consume fewer stores than a 1000-person contingent under similar circumstances. For the purpose of this project, it was assumed that a proportional relationship exists between contingent size and general stores consumption. In other words a 1000-person contingent is expect to consume twice as much as a 500-person contingent would consume. Employing the baseline scale to forecast future consumption, this assumption can be expressed in the following manner:

$$Contingent\ Consumption_i = Contingent\ Strength\ X\ (Annual\ Usage_i\ /1000) \quad \forall i$$

Where $Contingent\ Consumption_i$ is the expected annual consumption for item i of the scale, *Contingent Strength* is the number of people in the contingent being scaled for, and $Annual\ Usage_i$ is the consumption recorded in the 1000 person baseline scale for item *i*. This relationship is assumed to exist for all items *i* in the baseline scale.

19. The assumption of proportionality between consumption and contingent strength has not been tested and should be the focus of future work in this field. The other major factors that are known to affect general stores consumption are climatic conditions and operational activity. Unfortunately, these factors do not affect all general stores in any uniform manner. For example contingents deploying to a tropical climate environment are not likely to consume cold weather clothing at the same rate as an arctic deployment however both deployments will likely consume stationary items at the same rate.

Conversely, the operational activity of the two deployments could effect the consumption of stationary items since intense operational activity is likely to reduce the amount of administration performed. The inconsistent effect of these consumption factors on scales increases the difficulty of building a mathematical model that considers them. These factors will have to be considered by the planners who use the tool. Further work in this field could attempt to model these complex relationships.

20. The scaling tool was developed to enable planners to review and amend general stores scales. It is called the General Stores Scaler (GSS). GSS is a Microsoft Excel application. It employs the baseline scale contained in Annex C. The tool employs the size of the contingent being scaled for and the desired period of self-sufficiency to adjust the baseline scale. The results are presented to the user as proposed MAX and MIN stock levels for all items in the scale. The maximum stock level (MAX) for an item represents the quantity required to achieve a desired level of self-sufficiency. The minimum stock level (MIN) represents the reorder stock level for that item. The MAX and MIN stock levels are calculated in the following manner:

$$MAX_i = (Contingent\ Strength / 1000) \times (Scale Duration / 365) \times Annual Usage_i \qquad \forall i$$

$$MIN_i = 0.5 \times MAX_i \quad \forall i$$

21. MAX_i represents the recommended maximum stock level for item i of the baseline scale. *Contingent Strength* is the number of people in the contingent being scaled for. *Scale Duration* is the period of time, in days, the contingent must be self sufficient for. *Annual Usage* $_i$ is the annual usage of item i on the baseline scale. MIN_i is the recommended minimum stock level for item i of the baseline scale. All values of MAX_i and MIN_i are rounded to the nearest integer value. MIN_i is set to 0.5 of MAX_i based upon expert advice. Depending upon replenishment lead times, this value might require adjustment.

22. Users of GSS are presented with an adjusted baseline scale. Employing their knowledge of the operation, users can use most of the capabilities of Microsoft Excel to amend the scale further. Users can amend MAX or MIN for any item in the scale, new items can be added to the scale or items can be removed from the scale. Once the planner has amended the proposed scale, it can be saved, printed, or exported to another application. A copy of GSS is attached as Annex D. Annex E contains a user manual for the tool.

23. The current version of GSS is not a final product. As a prototype it will achieve several goals. It will enable a user evaluation of the baseline scale and the scaling tool. Once the concept of a GSS is validated and necessary improvements are identified other releases of the tool will be necessary. Future releases can attempt to accommodate some of the more complex scaling factor relationships. Additionally it will enable the proposed scaling process to be tried and evaluated. It would be wasteful to invest further resources in tool development before the principles and processes proposed in this document are validated.

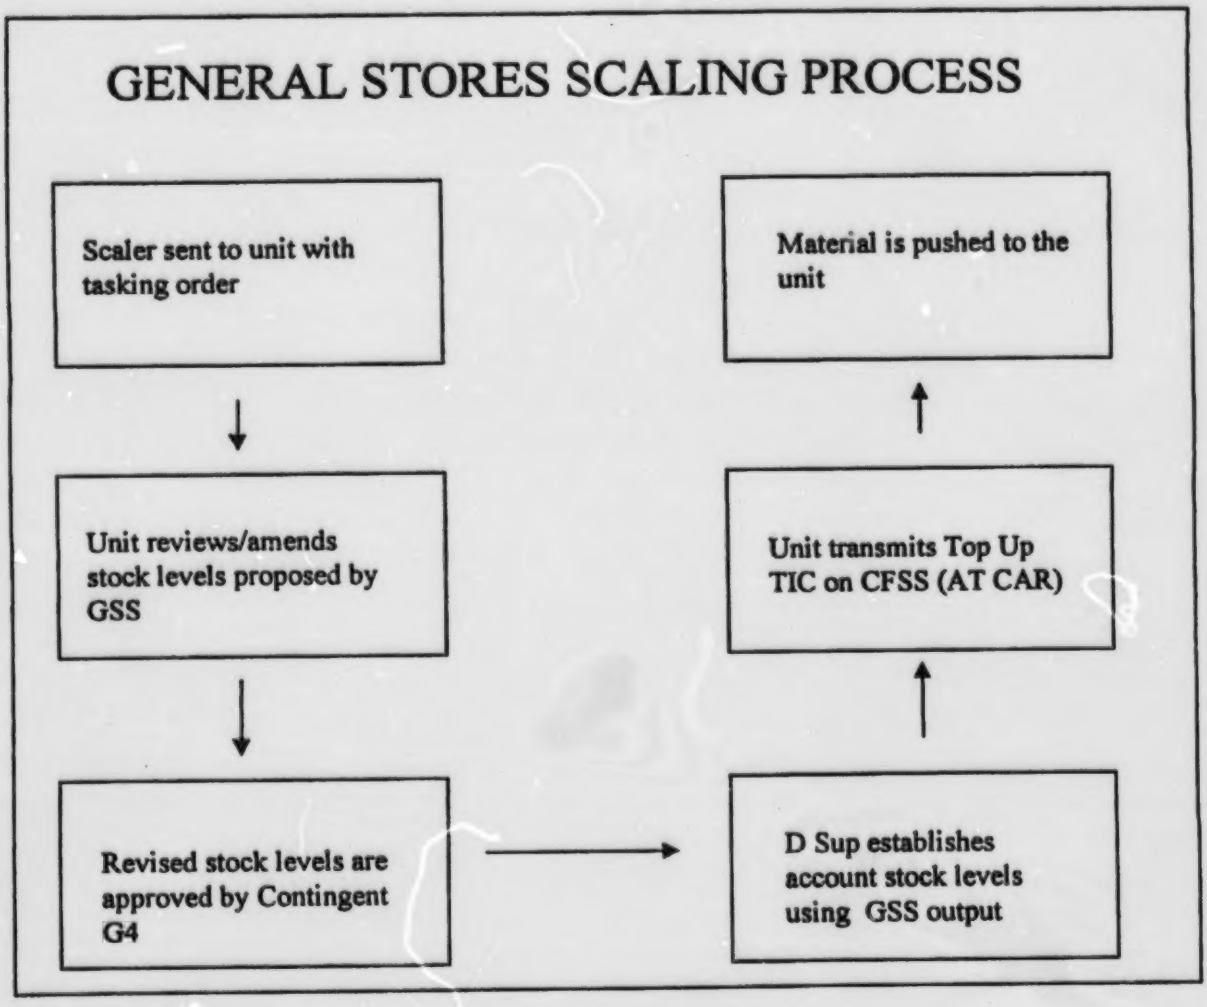
VI. GENERAL STORES SCALING PROCESS

24. The current scaling process does nothing to ensure that material self-sufficiency is maintained throughout the deployment. Once a deployment is underway, contingents tend to employ pull replenishment for most general stores. The use of pull replenishment, the demanding of material when required, is time consuming and prone to error. Each item has a unique consumption pattern. If supply technicians do not monitor the consumption of all material, reorder the items when required, and receive replenishment of the items before holdings are depleted, self-sufficiency is compromised. Inadequate re-supply during an operation has many of the same costs associated with it as inadequate scaling does during the deployment phase of an operation.

25. The alternative to pull replenishment for general stores is push replenishment. Push replenishment relies upon the CFSS to initiate replenishment when required with limited supply technician involvement. It is based upon the establishment of maximum and minimum stock levels for all items under consideration. As stocks of items are consumed, the CFSS is advised using computer transactions. When the quantity of a stock drops to its MIN, the CFSS automatically initiates action to send sufficient quantities of the item to return the stock to the MAX. Minimum stock levels are determined based upon the replenishment lead-time required. Despite the widespread employment of push replenishment domestically in the CF, there is a reluctance to employ push replenishment of general stores for deployed operations. This reluctance is primarily due to the fear that push replenishment based upon a poorly developed scale will create surplus holdings and not respond fast enough for deployed operations. Supply activities for deployed operations are characterised by their high cost of deployed replenishment, extremely limited supply staffing, and inadequate warehousing facilities. These characteristics emphasise the risks associated with inadequate scaling making push replenishment an unacceptable option. Only by improving a contingent's ability to forecast consumption can push replenishment be employed. Therefore, a scaling process, which develops reliable stock levels for material, can improve material self-sufficiency throughout the deployment

26. The creation of an accurate and timely general stores scale does not resolve the entire scaling challenge. It is a good starting point for the process but many additional activities are required to implement a scale. These steps include, demanding, receiving, and preparing the material for deployment. Additionally once the contingent deploys the stores must be replenished. One of the criticisms of the current scaling process is the time and effort required to implement a scale. Therefore an objective of this project was

to streamline the scaling process. As a first step in developing an improved scaling process, discussions were held with D Sup to identify the technical limitations on the scaling process [4]. Subsequent brainstorming sessions with subject matter experts were held. A proposed scaling process was developed which employed a software tool (GSS) to assist in the establishment of scales and made use of the strengths of the CFSS. Once this process has been tested and validated it can be included in supply procedures and integrated into the CFSS computer system.



GENERAL STORES SCALING PROCESS
Scaler sent to unit with tasking order
Unit reviews/amends stock levels proposed by GSS
Revised stock levels are approved by Contingent G4
D Sup establishes account stock levels using GSS output
Unit transmits Top Up TIC on CFSS (AT CAR)
Material is pushed to the unit

Figure 1: Proposed Scaling Process

27. The proposed scaling process is illustrated in Figure 1. The process begins when a unit is tasked to deploy. The unit will be given GSS to develop its general stores scale. Using GSS, the unit will review the scale proposed by GSS, amend it as required and submit their revised version of the GSS scale in electronic form to the G4 responsible for the deploying contingent. Once approved by the contingent G4, the revised GSS scale is forwarded to Director of Supply (D Sup) in NDHQ. D Sup uses the revised GSS scale to establish MAX and MIN stock levels on the contingent supply account. Upon completion of this step, the contingent supply staff transmits one transaction on the CFSS to initiate replenishment of the account to the MAX stock levels. This "top up" of the account results in all material in the account being pushed to the unit without any other unit action

28. There are several benefits created by this process. Use of GSS should improve the quality and accuracy of the scale employed for a deployment. GSS should also speed up the scale establishment task. The use of D Sup to establish stock levels on unit supply accounts and the subsequent top up of the account will greatly reduce the work and time required of the unit acquiring the material. It will also reduce the number of data input errors on the CFSS. The quick establishment of requirements on the CFSS will give the supply system more time to respond and it will allow unit supply staff more time to receive, account for, and prepare the supplies for shipment. Once the unit deploys and begins consuming the material, the CFSS will continue to push material to the unit whenever MIN stock levels are reached. This will reduce the workload of the contingent supply staff maintaining the stocks. Once material usage experience has been gained, the supply staff will be able to adjust stock levels. This process should ensure that excess stocks are not held in theatre but that the desired level of self-sufficiency is maintained.

29. A trial of the proposed process should be the next step in this project. If the expected benefits of this process are created, further work will be justified. Once the process has been employed and improved upon, action will be required to implement it as a standard practice in deployment planning.

VII. RECOMMENDATIONS

30. The work on the general stores scaling project has created a greater insight into the scaling process. Weaknesses in the current system have been found and opportunities for improvement have been identified. The proposed changes to general stores scaling could significantly reduce the direct and indirect costs of deployed operations. In order for these benefits to be achieved, future work in this field is required.

31. It is recommended that the following action be taken to enhance the general stores scaling capabilities of the CF

a. Evaluate Baseline Scale. The baseline scale developed for this project should be considered as a first attempt at a general stores scale. There exists potential for further improvements. User feedback is required to identify how the scale can be improved. Further research into prior usage of other deployed contingents should create improvements to the baseline scale also.

b. Evaluate GSS. GSS is a prototype scaling tool that should enable quicker and more accurate general stores scaling. If employed properly it can also help ensure efficient and effective sustainment of general stores. A significant amount of work has been expended creating the tool but it is not a final product. It would benefit from user evaluation and subsequent adaptation. Once the tool has been thoroughly tested, the capabilities of the tool should be integrated into the CFSS software suite.

c. Scaling Process Trial. The proposed process for general stores scaling must be tried before it can be implemented permanently. Although there appear to be many benefits to this process there may also be unknown consequences. Therefore the process should be tried during the next deployment to identify its strengths and weaknesses.

d. Enhanced Scaling Capabilities. There is potential to enhance the scaler's capabilities in several ways. The scale could have the items grouped into subsets according to the factors that influence their consumption (EG. Weather, environment, etc.). Scaling factors could be developed to adjust the consumption figures for the deployment under consideration. Another possible enhancement could be the inclusion of stochastic modelling of the consumption to create more realistic consumption estimates. Finally,

minimum and maximum stock levels could be developed that accounted for the re-supply time and the support structure associated with a specific mission.

32. The first three recommended actions are related. It would be possible to implement them all at once but this course of action is not recommended. A progressive approach to the implementation of this process is recommended. Potential users of the tool should evaluate GSS and the baseline scale first [2]. Once the weaknesses of these two important parts of the scaling process are identified and corrected, a test of the entire general stores scaling process should be undertaken. Once the current work has been validated and corrected, the final set of recommended actions should be considered. These actions should only be undertaken if the improved scaling capability will actually be valuable to the user. This information should become available during the evaluation of the current work.

---

2 An evaluation of GSS and the baseline scale was initiated with CCSFOR in January 1998.

ANNEX A
DOR(J&L) RN 9807
MARCH 1998

CONSUMPTION CALCULATION MODEL

For a deployed contingent with p issue transactions to contingent general stores supply accounts for item i, and n demand transactions from contingent general stores supply accounts for item i, let C_i be the contingent consumption of item i, X_{ij} be the quantity demanded for item i in transaction j, and Y_{ik} be the quantity of item i issued to a contingent general stores supply account on supply transaction k. The consumption calculation model for each general stores item i is:

$$C_i = \sum_{j=1}^{n} X_{ij} + \sum_{k=1}^{p} Y_{ik} \qquad j = 1,2,\cdots n, \quad and \quad k = 1,2,\cdots p \qquad \forall i$$

X_{ij} and Y_{ik} are transactions that record unique forms of consumption. Each occurrence of material consumption is registered by one of these two types of transaction but not both.

ELIGIBLE STOCK CLASSES

The following stock classes were used to select material usage information for baseline scale development

CLASS	EQUIPMENT TYPE
1005	GUNS, through 30 mm
1080	Camouflages and Deception Eqpt
1095	Miscellaneous Weapons
1670	PARACHUTES ...
3510	LAUNDRY & DRY CLEANING EQUIP.
3740	PEST, DISEASE CONTROL EQUIP
3750	GARDENING TOOLS
4010	CHAIN & WIRE ROPE
4020	FIBRE ROPE & TWINE
4030	FITTINGS FOR ROPE, CABLE ...
4230	DECONTAMINATION EQUIP
4240	SAFETY/RESCUE EQUIP
4520	SPACE & WATER HEATING EQUIP.
4530	FUEL BURNING EQUIPMENT
4540	WASTE DISPOSAL EQUIPMENT
4910	MOTOR VEH MAINT EQUIP
5110	HAND TOOLS EDGED
5120	HAND TOOLS NON EDGED
5315	NAILS/PINS
5340	MIS HARDWARE
5350	ABRASIVE MAT
5510	LUMBER, WOOD MATERIALS
5530	PLYWOOD & VENEER
5835	SOUND RECORDING

CLASS	EQUIPMENT TYPE
5836	VIDEO RECORDING

Email: dhoyle@ora.dnd.ca

1. GENERAL

1.1 Introduction

The General Stores Scaler (GSS) is a prototype scaling tool. It has been developed to aid units/contingents planning deployments with their general stores requirements. The expected consumption of general stores is estimated based upon the number of personnel deploying and the number fo days of supply that the unit must deploy with. Once requirements have been identified maximum and minimum stock levels are suggested for each required item.

GSS is a Microsoft Excel application. .

1.2 Installation

GSS requires Microsoft Excel version 5.0 or higher to be installed on the computer. The GSS can be copied onto the hard drive of the computer (recommended) or accessed from the floppy disk. Users are encouraged to make a copy of the original file and retain the original disk as a back up.

1.3 Running GSS

GSS can be run by opening the Microsoft Excel application and opening the file Genscale.xls

2.0 *Working with GSS*

GSS employs a static database and dynamic data to generate scales. The static database contains material usage records and the dynamic data identifies the specific deployment being planned for. Once the Genscale.xls file has been opened within Microsoft Excel several dialog boxes will be presented to the user to read. In some cases the user has the option of amending default planning data. In all cases the user must select the *OK* button for the tool to proceed. The dialog boxes contain part of the dynamic data employed by the tool. Once the initial dialog boxes have been reviewed by the user, a proposed general stores scale is calculated. The user is given the option of amending the recommended stock levels for the stores or adding items to the scale. Once this step is complete a customises general stores scale is created.

2.1 Initial Inputs

After initiating GSS several dialog boxes are displayed in succession. One dialog box asks the user to identify the size of contingent that is being scaled for. That is the number of people who will be consuming the general stores. The default value is 1000 persons. The user can amend this value by clicking the mouse in the contingent size box and typing the correct number. Once complete, the *OK* button must be selected. The next dialog box confirms the number of days of supply you wish to scale for. Typically, general stores are scaled for 30 days self-sufficiency by each deploying unit but each operation can create different requirements. Amendments to the 30 days of supply planning figure are made in the days of supply section of the dialog box. Upon acceptance of the initial dialog boxes the main planning interface will appear.

2.2 Reviewing the Scale

After providing the initial inputs to GSS, the user is presented with the main planning interface. The main planning interface is composed of a table with two main sections. The top section contains general information about the scale being developed including the dynamic data provided/approved by the user. It also contains the column headings for the second section of the interface. The second section contains the proposed scale information and some columns to amend/annotate the scale. Each item in the scale is recorded on a separate row. Since the scale is too large to appear on the screen all at once, the user can scroll through the rows of the scale using the scroll bar on the right side of the screen.The table columns are as follows:

- **Stock Number** The NATO stock number (NSN), Manufacturers number, or Locally assigned number that identifies the item.
- **Description** A short textual description of the item
- **SSI** Special Supply Instruction, any information about the item that is maintained in the CFSS eg. KM – Procure Locally
- **ACY** Accountability Code. The material accountability procedures associated with the item.
- **UI** Unit of Issue – The way the item is accounted for. eg. EA – each, MX - 1000
- **Proposed Max** The maximum holding quantity for the item proposed by GSS. This is the quantity that the CFSS will replenish to when automated replenishment is in effect.
- **Proposed Min** The proposed minimum quanity to be held before automated replenishment of the item is instituted.
- **Scaled Max** Tha actual maximum quantity of the item scaled for by the user. The user can amend this quantity if the proposed maximum quantity is unsatisfactory.
- **Scaled Min** The actual minimum quantity of the item to be held before automated replenishment is instituted. The user can amend this quantity if the proposed minimum quantity is unsatisfactory
- **Remarks** The user can insert textual remarks in this column.

UNCLASSIFIED

SECURITY CLASSIFICATION OF FORM
(highest classification of Title, Abstract, Keywords)

DOCUMENT CONTROL DATA
(Security classification of title, body of abstract and indexing annotation must be entered when the overall document is classified)

1. ORIGINATOR (the name and address of the organization preparing the document. Organizations for whom the document was prepared e.g. Establishment Sponsoring a contractor's report, or tasking agency, are entered in Section 8).

Operational Research Division
Department of National Defence
Ottawa, Ontario K1A 0K2

2. SECURITY CLASSIFICATION (overall security classification of the document, including special warning terms if applicable)

UNCLASSIFIED

3. TITLE (the complete document title as indicated on the title page. Its classification should be indicated by the appropriate abbreviation (S, C or U) in parentheses after the title)

A Heuristic Approach to General stores Scaling for Deployed Operations

4. AUTHORS (last name, first name, middle initial)

Hoyle, Maj Doug

5. DATE OF PUBLICATION (month Year of Publication of document)

March 1998

6a. NO OF PAGES (total containing information. Include Annexes, Appendices, etc.) 68

6b. NO OF REFS (total cited in document) 5

7. DESCRIPTIVE NOTES (the category of document, e.g. technical report, technical note or memorandum. If appropriate, enter the type of report e.g. interim, progress, summary, annual or final. Give the inclusive dates when a specific reporting period is covered.)

Research Note

8. SPONSORING ACTIVITY (the name of the department project office or laboratory sponsoring the research and development. Include the address).

J4 Log

9a. PROJECT OR GRANT NO. (if appropriate, the applicable research and development project or grant number under which the document was written. Please specify whether project or grant.)

3561-LDO - G

9b. CONTRACT NO. (if appropriate, the applicable number under which the document was written.)

10a. ORIGINATOR's document number (the official document number by which the document is identified by the originating activity. This number must be unique to this document.)

DOR(J&L) Research Note RN 9807

10b. OTHER DOCUMENT NOS. (Any other numbers which may be assigned this document either by the originator or by the sponsor.)

---

11. DOCUMENT AVAILABILITY (any limitations on further dissemination of the document, other than those imposed by security classification.)

(X) Unlimited distribution
( ) Distribution limited to defence departments and defence contractors: further distribution only as approved
( ) Distribution limited to defence departments and Canadian defence contractors; further distribution only as approved
( ) Distribution limited to government departments and agencies; further distribution only as approved
( ) Distribution limited to defence departments; further distribution only as approved
( ) Other (please specify):

12. DOCUMENT ANNOUNCEMENT (any limitation to the bibliographic announcement of this document. This will normally correspond to the Document Availability (11). However, where further distribution (beyond the audience specified in 11) is possible, a wider announcement audience may be selected.)

UNCLASSIFIED

SECURITY CLASSIFICATION OF FORM

13. ABSTRACT (a brief and factual summary of the document. It may also appear elsewhere in the body of the document itself. It is highly desirable that the abstract of classified documents be unclassified. Each paragraph of the abstract shall begin with an indication of the security classification of the information in the paragraph (unless the document itself is unclassified) represented as (S), (C), or (U). It is not necessary to include here abstracts in both official languages unless the text is bilingual).

The problem of scaling general stores for deployed Canadian Contingents was investigated. Weaknesses in the current system were identified. A baseline general stores scale was created based upon consumption data from the Former Yugoslavia. A prototype software application for review and customisation of the baseline scale was developed. An improved scaling process was identified which shortens the scaling process and enables general stores to be sustained in theatre more easily. Recommendations for future work in this field were provided.

14. KEYWORDS, DESCRIPTORS or IDENTIFIERS (technically meaningful terms or short phrases that characterize a document and could be helpful in cataloguing the document. They should be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location may also be included. If possible keywords should be selected from a published thesaurus, e.g. Thesaurus of Engineering and Scientific Terms (TEST) and that thesaurus-identified . If it is not possible to select indexing terms which are Unclassified, the classification of each should be indicated as with the title.)
